

Características radiómicas por clase (primer orden + GLCM)

Característica	Clase 0 (lóbulos)	Clase 1 (fondo)
N pixeles	30934	13066
Media	45.62	71.36
Entropía (1er orden)	4.7505	4.9724
Skewness	-0.1929	0.6646
Curtosis	2.2190	3.1455
Autocorrelación (GLCM)	2105.22	5237.02
Contraste (GLCM)	2.6818	9.5865
Energía conjunta (GLCM)	0.012122	0.004764
Entropía conjunta (GLCM)	7.0506	8.3214

Heatmap visualization of the probability distribution $p(i,j)$ for quantized levels of two grayscale images. The x-axis represents the quantized level of image j (Nivel de gris j (cuantizado)), and the y-axis represents the quantized level of image i (Nivel de gris i (cuantizado)). Both axes range from 28 to 106. The color scale indicates the probability $p(i,j)$, ranging from 0.000 (dark purple) to 0.175 (yellow). The highest probability value, 0.184, is observed at the intersection of level 70 for both images.
